Koskisen Kore® in a nutshell 2026

Kore® van linings

Perfectly designed | Precisely manufactured | Promptly delivered

Any van, Kore can.

What if you could have **VAN SOLUTIONS** *that are not only of the* **HIGHEST QUALITY** *but also* **CRAFTED BY SPECIALISTS WHO CARE** – **FROM THE FOREST TO THE VAN?**

» WE KNOW SOMETHING OTHERS DON'T

We are Europe's most ambitious van lining producer. The main raw material in our plywood products is renewable wood. The wood used in our plywood comes from Finnish forests, where forest regeneration is required after harvesting.

We offer regeneration services for forest owners that support the renewal of forest resources and contribute to the long-term availability of high-quality wood raw materials.

We manage key stages of the process, from sourcing wood for our plywood to manufacturing and machining Kore kits. This gives us visibility into the journey from the forest to the van.

We produce our plywood in-house and we honour this amazing wood and our customers with equal respect. Our process follows demanding quality and production standards, giving you peace of mind.

We know what we are talking about. **Cover it with Kore.**

»Who are Koskisen Kore® and why we have something to say?

Kore® is a brand and a business unit of the internationally renowned **wood products specialist** Koskisen, whose headquarters and panel manufacturing is in Järvelä, Finland.

Kore® product range for LCV (light commercial vehicles) consist of a range of ready-to-install cargo interior protection sets for for the most common van models available in the European market. Both of our Kore® Service- and Machining Centers are located in Poland, close to our customers.

Did you know? *Wood-based materials store biogenic carbon during their service life.*

»Woodwise choice

Wood is a renewable raw material when forests are regenerated and managed to maintain future growth. Renewable raw materials and non-renewable materials can have different environmental impacts, which should be assessed using product- and application-specific data.

At Koskisen, different parts of the log are used for plywood and chipboad production. Not a single chip is wasted.
