Koskisen on the path to sustainable growth

Koskisen is an international wood processing specialist known for its agility and ability to listen to the customer.

The Sawn Timber Industry produces sawn timber and processed products. Wood procurement is part of the Sawn Timber industry. The Panel Industry segment produces plywood, thin plywood, veneer, chipboard and interior solutions for light utility vehicles under the Kore brand.

Koskisen's customers include the logistics, construction, automotive, die-cutting, furniture, interior decoration, packaging and chemical forest industries. Some of Koskisen's products are also sold to wholesalers and distributors.

Koskisen mainly procures wood from private forest owners in Finland and complies with the requirements of the PEFC and FSC[®] chain-of-custody certificates in all of its wood procurement. Koskisen's production facilities are located in Finland and Poland.

We utilise our valuable wood raw material as thoroughly as possible, up to the last particle of sawdust. We manufacture high-quality and sustainable circular bioeconomy products that store carbon for decades.

Woodwise is at the core of our operations

Koskisen is a responsible and woodwise operator globally. At Koskisen, woodwise is an all-encompassing philosophy of using wood. It is the critical partnership between people, the forest and knowing the true value of wood. Koskisen uses the wood entrusted to it with precision and constantly develops its ability to use wood with increasing efficiency and respect. It means, for example, that we utilise side-streams as raw materials for our products and as a source of thermal energy in production.

We have also invested in the latest technology to ensure that we can make use of the wood we use down to the very last particle of sawdust.

Taking woodwise steps towards renewable societies

Koskisen is helping to make the green transition a reality every day, with the aim of creating increased value for our customers, personnel, shareholders and society as a whole.

Our operations are based on being woodwise. We consider both the forest and society as partners in our operations. We use the wood entrusted to us precisely, and constantly develop our ability to use wood with greater efficiency and respect.

We meet the growing demand of the global wood products market.

Woodwise for our customers

We help our customers succeed, mitigate climate change and adapt to the future through our products and services.

Together with our customers, we take into account specific application requirements already in the product design phase. We create value for our customers by providing high-quality tailored products, customer-oriented services and innovative solutions.

Koskisen aims to be a creative and agile player in the wood product markets, continuously developing innovative solutions for existing and new customers. Our customer-driven approach and customisation enable even small production batches.

Woodwise utilisation of raw materials

Woodwise at Koskisen means that we make the most of roundwood and not a single chip is left unused. Wood is a sustainable raw material that stores carbon throughout its lifecycle and can be used to produce an endless variety of products and materials.

The material and resource efficiency of Koskisen's operations is high. Koskisen manages different material flows efficiently and uses raw materials from different sources as fully as possible in its production of plywood, sawn timber products and chipboard.

The remaining wood material that cannot be utilised in Koskisen's products or production is sold to other industries or for energy use.

Sawn Timber Industry

A large share of Koskisen's wood products are used for long-term applications, such as in the construction industry, which results in a carbon handprint.

For wood products, carbon handprint means the storage of organic carbon in products away from the atmosphere.

Production sidestreams, such as sawdust, are used in furniture and building panels instead of being incinerated, and their carbon is also stored in a long-term cycle.

The by-products generated during turning and processing are used in the production of chipboard and renewable energy.

Sawn Timber Industry

Koskisen's Sawn Timber Industry produces sawn timber and processed products from high-quality wood raw material. Its turnover is comprised of sales of sawn timber and processed timber to construction end users (professionals and DIY) and companies in the packaging, carpentry and furniture sectors.

Sawn Timber Industry also includes a wood procurement function, which acquires raw material for its own production and sells by-products to the pulp and paper industry as well as to power plants that use bioenergy. Sawn timber and processed products are also sold to a significant extent to markets outside Finland, especially to Japan (JAS certificate).

Sawn timber

Koskisen manufactures both standard sawn timber and high-precision and strength graded sawn timber from spruce and pine.

Processed timber

Koskisen further processes approximately 20 per cent of the sawn timber it produces mainly by planing and, to a lesser extent, by painting.

Bioenergy

Koskisen supplies raw materials to several bioenergy power plants – including to the on-site power plants at its production facilities.

Wood Procurement

Koskisen procures wood mainly from private forest owners in Finland and offers them forestry services. Koskisen uses the majority of the wood it procures in its own operations and sells the rest to third parties, such as for energy use and to the chemical forest industry.

Koskisen complies with the requirements of the PEFC and FSC® chain-of-custody certificates in all wood procurement.

A chain-of-custody system in all procurement ensures that wood material is sourced legally and ethically from reliable and identified sources.

The origin of all raw materials is always verified so that the forests in protected areas are safeguarded, and wood is not sourced from controversial sources.

Panel Industry

Koskisen's Panel Industry offers customised high-quality panel solutions. Panel Industry produces birch plywood, thin plywood, veneers, chipboard and optimised interior solutions for vans and trucks. The majority of the total production of Panel Industry is sold abroad, while Finland is the main market for chipboards. The largest customer groups are the construction, vehicle and furniture industries.

Plywood

Koskisen manufactures customised birch plywood panels for the construction, laser die-cutting, interior design and cabinetry industries as well as specialist panels for the transport industry, such as flooring for trains, heavy trailers and light commercial vehicles.

Chipboard

Koskisen produces a wide range of chipboard products from sawdust and wood chips generated as by-products in Koskisen's sawmill and birch plywood production. The chipboard products are manufactured at Koskisen's production plant in Järvelä, which is the only chipboard factory in Finland.

Thin plywood

Koskisen manufactures durable and flexible thin plywood and birch veneer, which are suitable for laser cutting, moulding, design products, interior elements, lamps, technical panels, scale models and puzzles and CNC machining.

The largest end-user segments of Koskisen's thin plywood and veneer are the furniture and carpentry industry.

Our Zero product family meets the growing demand for biobased solutions. Thanks to Zero, furniture and lighting manufacturers, jewellery designers, toy makers, and the construction industry can now offer their customers even more climate-friendly and health-safe alternatives.

thinplywood.com

In the Thin Plywood Online Store, you'll find products tailored to the needs of both small businesses and home crafters alike.

At our production unit in Poland, we produce durable, high-quality and precisely designed cargo space protection solutions under the brand name Kore®, suitable for the most common vans in the European market.

The Kore® product range includes floor, wall and ceiling lining kits, as well as various wheel arch covers to protect the surfaces of the cargo space. We also offer special machining and other customised solutions (e.g. for public transport).

Sustainability

Koskinen's operations are based on biodiversity-conscious forestry and competent wood sourcing, the processing of wood into bioeconomy products, the green transition, and the creation of added value for customers and other stakeholders. We manage sustainability as part of strategy and operational activities in accordance with our values.

Koskisen as an employer

Since our business is based on forests, addressing environmental, climate and social impacts is at the core of our strategy.

The value chain is built on material-efficient and interconnected processes covering harvesting, production, and deliveries. This integrated model enables growth while maintaining flexibility and efficiency.

Beyond its approximately 1,000 employees, the company indirectly provides employment for about 4,000 individuals. Additionally, the company offers summer job opportunities each year.

Meaningful work for employees is created through a safe working environment and high-quality working conditions, fair treatment, continuous competence development and the fostering of well-being at work.

A safe workplace is a primary starting point and requirement for all activities. Koskisen works hard to achieve an accident-free working environment and working day.
